CHLAMYDIA INFECTION

BASIC INFORMATION

DESCRIPTION
Chlamydia are intracellular parasites that have many of the same physical characteristics of viruses. They cause inflammation of the urethra (the tube that allows urine from the bladder to pass outside the body), vagina, cervix, uterus, fallopian tubes, anus and ovaries. This is a common sexually transmitted disease. Chlamydia infection may also be transmitted to the eyes or lungs of a newborn infant. If Chlamydia are found by microscopic exam or culture of discharge in any person who is sexually active, all sexual partners must be treated.

FREQUENT SIGNS AND SYMPTOMS

- Sometimes no symptoms during early stages.
- Vaginal discharge.
- Urethral discharge (males).
- Anal swelling, pain or discharge.
- Reddening of the vagina or tip of the penis.
- Abdominal pain.
- Fever.
- Discomfort on urinating.
- Genital discomfort or pain.

CAUSES
Chlamydia trachomatis bacteria spread by:
- Vaginal sexual intercourse.
- Rectal sexual intercourse.
- Oral-genital contact.
- Vaginal infection during delivery of a newborn, which may infect the baby.

RISK INCREASES WITH

- Unprotected sexual activity, particularly in young females.
- Diabetes mellitus.
- General poor health.
- Hot weather, non-ventilating clothing (especially underwear), or any other condition that increases genital moisture, warmth and darkness. These foster the growth of germs.

PREVENTIVE MEASURES

- Use of condoms during sexual activity.
- Treatment of all sexual partners of any infected person (usually 2 weeks of an oral antibiotic such as tetracycline).

EXPECTED OUTCOMES
Complete cure with adequate antibiotic treatment.

POSSIBLE COMPLICATIONS

- Sterility in female.
- Infecting one’s sexual partner.
- Secondary bacterial infections in pelvic organs, genitals or rectum.
- May complicate pregnancy.
- Liver infection (perihepatitis).
- Reiter’s syndrome.

TREATMENT

GENERAL MEASURES

- Diagnostic tests may include vaginal smear, rectal smear and urethral smear for laboratory analyses.
- Keep the genital area clean. Use plain unscented soap.
- Take showers rather than tub baths.
- Wear cotton underpants or pantyhose with a cotton crotch. Avoid those made from non-ventilating materials, such as nylon.
- Don’t sit around in wet clothing, especially a wet bathing suit.
- After urination or bowel movements, cleanse by wiping or washing from front to back (vagina to anus).
- Lose weight if you are obese.
- Avoid douches.
- If you have diabetes, adhere strictly to your treatment program.
- Avoid pants that are tight in the crotch and thighs.
- Change tampons frequently.
- If urinating causes burning, urinate through a tubular device, such as a toilet-paper roll or plastic cup with the end cut out, or pour a cup of warm water over genital area while urinating.
- A follow-up medical examination is necessary after completing the prescribed treatment.
- Testing for other sexually transmitted diseases is recommended.

MEDICATIONS

Oral antibiotics, such as tetracycline, taken for 2 weeks.

ACTIVITY

- Avoid overexertion, heat and excessive sweating.
- Delay sexual relations until treatment is completed and symptoms are gone.
- Allow about 3 weeks for recovery.

DIET

No special diet.

NOTIFY OUR OFFICE IF

- You or a family member has symptoms of Chlamydia infection.
- Symptoms persist longer than 1 week or worsen despite treatment.
- Unusual vaginal bleeding or swelling develops.
